The data source connection includes a name and connection settings that are dependent on the data source type.. Connect to a database To issue a query to a database, you must connect to a data source.

1. [data source](#)
2. [data sources in research](#)
3. [data source name not found](#)

The data source is a location of your data (it can be a database, CSV, or a DDL file).. In DataGrip, you can manage these connections in the Data Sources and Drivers dialog (File Data Sources).

data source

data source, data source reference is not valid, data source terraform, data sources in research, data source in mail merge, data source name not found, data source credentials greyed out, data source name, data sources in qualitative research, data source is also called the
